

UNIFIEDSEC TECHNOLOGIES

# MACE

## Multi-Domain Adaptive Correlation Engine

Unified threat correlation and automated regulatory evidence  
for US, EU, and GCC regulated markets.

**Seed — \$5M in two tranches • Phase 1: \$750k** Platform built and tested • 156/156 automated tests •  
Provisional patent in counsel review

# Five disconnected tools — and a second job after every breach

## Asset inventory

No threat scoring

## EDR

Single domain

## Vuln scanner

Periodic, no identity

## SIEM

Manual rule tuning

## Compliance

Not incident-driven

## Hours of manual correlation

Analysts reconcile alerts across consoles with no shared asset identity — while attacker dwell time accumulates. Every serious incident then triggers a parallel compliance fire drill.

## Regulatory deadlines are brutal

- FedRAMP SIR — 1 hour
- DORA — 4 hours from classification
- NIS2 — 24-hour early warning
- GDPR Art. 33 — 72 hours
- SEC 8-K — 4 business days

# One pipeline: identity → correlation → evidence

## UTAG

### Universal Temporal Asset Graph

Probabilistic asset identity across 11 classes. Hardware-ID-boosted matching, time-decaying confidence, shadow-IT and geo-velocity detection.

## CDCS

### Cross-Domain Correlation Score

Explainable 7-domain score (0-10). EPSS + CISA KEV, MITRE ATT&CK kill-chain and blast-radius multipliers. Weights adapt to analyst feedback.

## UREA

### Universal Regulatory Evidence Automaton

State machine generating tamper-evident SHA-256 evidence chains and pre-filled notification drafts for 14 frameworks in minutes.

**Patent-pending core.** 30 claims drafted across 7 components — US provisional in final counsel review; PCT within the 12-month window.

# An explainable formula — not a black box

$$CDCS = \min(10, [\alpha \cdot V + \beta \cdot E + \gamma \cdot I + \delta \cdot N + \varepsilon \cdot C + \zeta \cdot T + \eta \cdot H] \times 10 \times \text{Sector} \times \text{Blast} \times KC \times ACS)$$

## V Vulnerability

CVSS · EPSS · KEV · exposure

## E Endpoint

EDR telemetry, kill-chain stage

## I Identity

Impossible travel, MFA abuse

## N Network

Lateral movement, C2, exfil

## C Compliance

STIG pass rate, patch gap

## T Threat intel

IOC, campaign, actor

## H Endpoint posture

Agent-attested device state

## Adaptive

Weights learn from analyst TP/FP feedback per jurisdiction

# The product phase is substantially complete

## Algorithm core

156/156 automated tests passing (verified June 2026)

## SaaS backend

FastAPI · 9 DB models · 6 API route groups · JWT + encryption

## SOC dashboard

React 18/TS · executive KPI summary · real-time WebSocket

## Admin portal

Tenant config · user management · billing scaffolding

## Connectors

CrowdStrike · Tenable · Splunk · Axonius · MISP · agent ingest

## Infrastructure

Terraform multi-region · Helm · CI/CD · Prometheus

**Honest gaps:** no customers, no third-party audit, no SOC 2 yet — all four are funded objectives of this round.

# One agent, attested telemetry, learning that compounds

## UMEA agent

Single-pass scan on Windows / macOS / Linux / Android / iOS: inventory, STIG/CIS, CVE matching, EDR rules, DLP, SBOM, honeytokens.

## Hardware attestation

Reports signed by Secure Enclave / TPM 2.0 / Strongbox — a compromised agent cannot lie about its own state.

## Federated learning

Correlation weights improve across customers with differential privacy. Raw events never leave the environment.

## Macey assistant

Tool-using GenAI over the whole platform, with deterministic fallback for air-gapped sites and a safety allowlist.

*Positioning: consolidates core functions of point products for the mid-market — the wedge is correlation + regulatory evidence, which no incumbent ships together.*

# Regulation is the forcing function

## FedRAMP

Continuous monitoring + 1-hour SIR for federal cloud providers

## SEC 8-K

Cyber disclosure rule covers every US public company

## NIS2 (enforced Oct 2024)

~160,000 EU essential/important entities, 24h reporting

## DORA (applies Jan 2025)

EU financial entities, 4-hour ICT incident reports

## UAE NESAs / aeCERT

Immediate notification for critical infrastructure

## CMMC 2.0

DoD contractor base needs CUI incident evidence

**Context, not promises:** Axonius — \$200M at \$2.6B (2024, ~\$100M ARR) · Wiz — \$32B Google acquisition closed Mar 2026 · Vanta/Drata — unicorns on audit-prep alone.

# Honest view: strong incumbents, empty intersection

| Capability                                    | MACE     | Closest incumbent today                            |
|-----------------------------------------------|----------|----------------------------------------------------|
| Cross-tool asset identity w/ temporal decay   | Yes      | Axonius — rule-based, no decay or confidence score |
| Explainable multi-domain pre-alert score      | Yes (7)  | SIEM rules (manual); XDR scores (single-vendor)    |
| EPSS / KEV exploit-probability prioritization | Yes      | Tenable VPR, CrowdStrike ExPRT.AI — partial        |
| Adaptive weights from analyst feedback        | Yes      | No direct equivalent identified                    |
| US + EU + UAE breach-notification automation  | Yes (14) | Point tools cover subsets; none spans all three    |
| Tamper-evident evidence chain + attestation   | Yes      | Forensics tools — not wired to live correlation    |

*Real risks we watch: Microsoft (Sentinel/Defender) and Palo Alto (XSIAM) bundling; Vanta/Drata moving into incident-driven evidence. Defenses: patent filings, vendor neutrality, jurisdiction library depth.*

# Per-asset SaaS, priced against the stack it consolidates

## Starter

**\$12**

per asset / year

Up to 500 assets — SMB and FedRAMP contractors. Land ~\$50k ACV with services.

## Professional

**\$9**

per asset / year

Up to 5,000 assets — mid-market regulated enterprise.

## Enterprise

**\$6-8**

per asset / year (custom)

Unlimited — large enterprise and government.

**Expansion lever:** compliance-evidence automation is budgeted from GRC, not just the SOC — two budgets per customer, one platform.

# 18 months to commercial proof

1

## Months 0-3 • Foundations

CTO/VP Eng search • file non-provisional + PCT • SOC 2 window opens • 3 design partners signed

2

## Months 4-9 • Validation

5 paying pilots (\$30-60k ACV) • SOC 2 Type II report • 3rd-party pen test • EU NIS2/DORA pilot

3

## Months 10-18 • Scale-up

\$750k-1.2M ARR target • FedRAMP 3PAO readiness • GCC reseller GTM • Series A from proof

## USE OF FUNDS

# \$5.0M — one reconciled budget, ~20 months runway

|                                              |        |
|----------------------------------------------|--------|
| Engineering & product (8 FTE incl. VP Eng)   | \$2.0M |
| Sales & marketing (VP Sales, AE, events)     | \$0.9M |
| Compliance — SOC 2, ISO 27001, FedRAMP prep  | \$0.5M |
| Cloud infrastructure & tooling (18 mo)       | \$0.4M |
| Legal & IP — non-provisional, PCT, corporate | \$0.4M |
| Threat-intel & data feeds                    | \$0.2M |
| G&A, insurance, finance                      | \$0.3M |
| Contingency                                  | \$0.3M |

**Tranched:** Phase 1 \$750k (founder + UAE engineer, market entry, SOC 2, UAE data residency) → Phase 2 \$4.25M on traction milestones.

# Honest about the gaps — and funded to close them

## Vivek Sindhu — Founder, CEO, Inventor

Designed and implemented the full MACE algorithm, the SaaS platform, the endpoint agent, and the patent application. Deep background in cybersecurity, distributed systems, and compliance engineering.

### First hires at close:

- CTO (co-founder economics offered)
- VP Engineering — FedRAMP delivery
- VP Sales — federal cybersecurity
- Compliance lead — SOC 2 / FedRAMP

## Top risks, named plainly

- No revenue yet — design partners are milestone one
- Single-founder concentration — CTO search, documented codebase, key-person insurance
- Patent may narrow — multiple claim families + trade secrets
- Incumbent bundling — vendor neutrality + jurisdiction depth

# Bootstrapped to a working platform — zero outside capital

## Funds raised to date

\$0 external — 100% founder-built and founder-funded

## Product traction

156/156 tests passing · live site (unifiedsectech.com) · local demo runs a 1,000-device fleet in under 2 minutes

## IP traction

30-claim US provisional patent in final counsel review · 12 figures · PCT planned within priority window

## Commercial pipeline

Design-partner program launched — 3 slots, locked 3-year pricing · outreach list: FedRAMP contractors + UAE critical infrastructure

*Why this matters: every dollar invested goes to market validation, not product completion.*

# The Gulf is our first revenue market — by design

## Why MACE fits the UAE

- UREA already automates NESAS IAS, aeCERT, and DIFC DPL notifications — no incumbent ships this
- Saudi NCA ECC support built → GCC expansion ready
- Air-gapped + data-sovereign deployment for government

## Our Hub71 commitment

- Founder relocates to Abu Dhabi for the program
- First regional hire: solutions engineer, local
- ADGM entity post-acceptance
- GISEC presence + UAE bank/telecom/CNI outreach

**Year-one Gulf goal:** 5 UAE critical-infrastructure design partners → first ARR from the market every US competitor ignores.

## THE ASK

**\$750k now to win the Gulf.  
\$4.25M on proof to scale it.**

**Phase 1 — \$750k:** founder + UAE solutions engineer · DIFC/ADGM entry · SOC 2 + pen test · UAE data-residency deployment · GISEC.

**Phase 2 — \$4.25M on milestones:** 3 UAE design partners + \$250k contracted ARR + SOC 2 underway → team buildout and US/EU scale.
